

Introduction To SalesPro Saas- Flutter POS Inventory Management App with Firebase, Subscription Packages, PayPal and Thermal Invoice Printing

Version: 5.2

Last Update 10-oct-2023

Published 12 October 2022

SalesPro Saas - Flutter POS Inventory Management App with Firebase is as the name says is dominating and powerful Flutter app contains complete app templates, ready to use screens, widgets, illustrations and stunning screens covering Mobile POS Inventory app. SalesPro SaaS - Flutter POS Inventory Management App with Firebase is developed with the highest quality, ease of reusing widgets, fast, and completely user-friendly interface. You can easily use these to make your Flutter POS Inventory Management App. SalesPro SaaS- Flutter POS Inventory Management App with Firebase makes the developer job easy to achieve the modern look and feel of the mobile application. It saves your hustle and time to develop a perfect design UI for modern-day-use mobile applications. There is a Subscription System for generating revenue using PayPal (More coming soon).

Prerequisite:

1 Android Studio: 4.1.2 2 Flutter Version: 3x For 24/7 support email us here: <a href="mailto:mai

Note: You have to pair the Bluetooth thermal printer with your mobile first to be able to print invoice from the application.

Tools & Setup

Prerequisite

- Flutter & Dart SDK
- Anyone IDE Android Studio (Recommended), Visual Studio Code or IntelliJ IDEA
- To edit this project you must have Flutter and Dart installed and configured successfully on your computer.
- Set up your editor Install the Flutter and Dart plugins.
- If you have got Android SDK installed and configured, to install Flutter you only need to:
 - Download Flutter SDK from official website and extract it.
 - Add path to previously extracted SDK to your PATH variable
 - Run flutter doctor tool to check if everything is configured correctly.
 - All above steps are mentioned here: https://flutter.dev/docs/get-started/install/

Android Studio – Windows

- Download Android Studio https://developer.android.com/studio/Get
- the Flutter SDK https://flutter.dev/docs/get-started/install
- Learn more about Android Studio https://developer.android.com/studio/intro/

Step 1: Get the Flutter SDK

1 Download the following installation bundle to get the latest stable release of the Flutter SDK:

2 Extract the zip file and place the contained flutter in the desired installation location for the Flutter SDK (for example, C:\src\flutter; do not install Flutter in a directory like C:\Program Files\ that requires elevated privileges).

Step 2: Update your path

If you wish to run Flutter commands in the regular Windows console, take these steps to add Flutter to the PATH environment variable: From the Start search bar, enter 'env' and select **Edit environment variables for your account**. Under **User variables** check if there is an entry called **Path**:

- If the entry exists, append the full path to flutter\bin using; as a separator from existing values.
- If the entry doesn't exist, create a new user variable named Path with the full path to flutter\bin as its value.

Important

Note that you have to close and reopen any existing console windows for these changes to take effect. You are now ready to run Flutter commands in the Flutter Console!

Step 3: Run flutter doctor

From a console window that has the Flutter directory in the path (see above), run the following command to see if there are any platform dependencies you need to complete the setup:

c:\src\flutter>flutter doctor

Android Studio – macOS

- Download Android Studio https://developer.android.com/studio/
- Download XCode https://apps.apple.com/us/app/xcode/id497799835?mt=12 Get
- the Flutter SDK https://flutter.dev/docs/get-started/install
- Learn more about Android Studio https://developer.android.com/studio/intro/

Step 1: Get the Flutter SDK

- Download the following installation bundle to get the latest stable release of the FlutterSDK:
- Download SDK and extract downloaded file, just double click on that. and just copy extracted folder and paste it to your desired location (for example, Documents\flutter).

Step 2: Update your path

Important

Path variable needs to be updated to access "flutter" command from terminal. you can just update path variable for current terminal window only. and if you want to access flutter commands from anywhere in terminal, we need to update SDK path permanently.

To update PATH variable, we need to open terminal.

To update PATH variable for current terminal window only, then enter this command "export PATH="\$PATH:`pwd`/flutter/bin"" and hit enter key.

To update PATH variable permanently, then Open or create .bash_profile file. to open or create that file, then enter "sudo open -e \$HOME/.bash_profile" and hit enter key.Append below line to bash_profile file at bottom of all other content. "export PATH="\$PATH: [PATH_TO_FLUTTER_GIT_DIRECTORY]/flutter/bin"" as

[PATH_TO_FLUTTER_GIT_DIRECTORY] is actual path of SDK folder.

Run this command on terminal "source \$HOME/.bash_profile" to refresh PATH variables. Then

check whether our SDK is successfully installed or not.

You are now ready to run Flutter commands in the Flutter Console!

Run "flutter doctor" into terminal, If you are getting check list of flutter sdk requirements, it means SDK is successfully installed on your machine. and you can start building flutter apps on your machine.

Android Studio – Linux

- Download Android Studio https://developer.android.com/studio Get
- the Flutter SDK https://flutter.dev/docs/get-started/install/linux
- Learn more about Android Studio https://developer.android.com/studio/intro/

Step 1: Get the Flutter SDK

- Download the following installation bundle to get the latest stable release of the FlutterSDK:
- Download SDK and extract downloaded file, just double click on that. and just copy extracted folder and paste it to your desired location (for example, Documents\flutter).

Step 2: Update your path

Important

Path variable needs to be updated to access "flutter" command from terminal. you can just update path variable for current terminal window only. and if you want to access flutter commands from anywhere in terminal, we need to update SDK path permanently.

You'll probably want to update this variable permanently, so you can run flutter commands in any terminal session. To update PATH variable, we need to open terminal.

- 1. Run source \$HOME/. to refresh the current window, or open a new terminal window to automatically source the file.
- 2. Verify that the flutter/bin directory is now in your PATH by running:

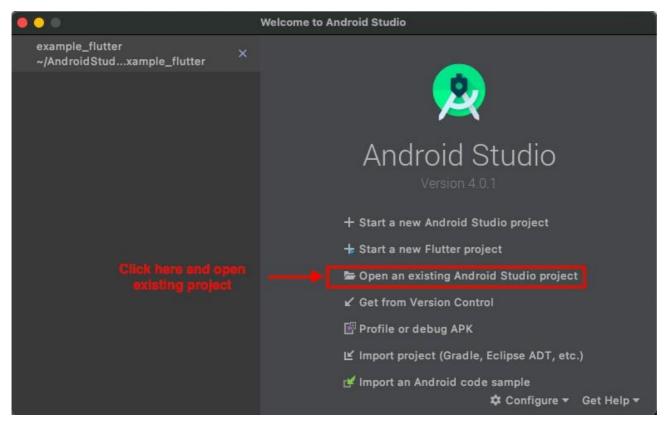

GETTING STARTED (BUILD & RUN)

Important

All below steps are must be followed to build and run application

Download Project

Download and find the your project folder, use your preferred IDE (Android Studio / Visual Studio Code / IntelliJ IDEA) to run the project.

logo

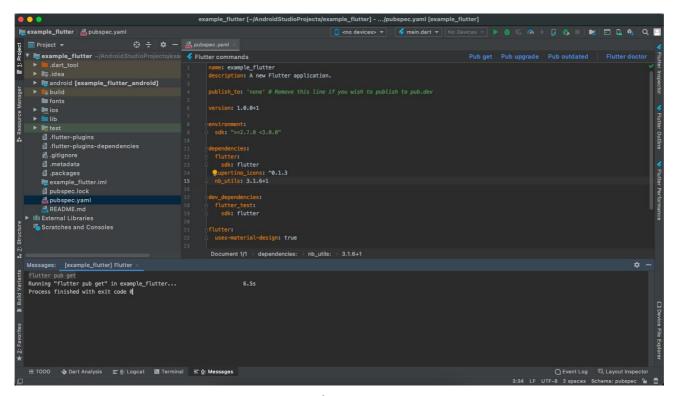

Get Dependencies

After you loaded project successfully, run the following command in the terminal to install all the dependencies listed in the pubspec.yaml file in the project's root directory or just click on Pub get in pubspec.yaml file if you don't want to use command.

flutter pub get

Important

All below steps are must be followed to build and run application

logo

Build and Run App

- 1. Locate the main Android Studio toolbar.
- 2. In the target selector, select an Android device for running the app. If none are listed as available, select Tools > Android > AVD Manager and create one there. For details, see Managing AVDs.
- 3. Click the run icon in the toolbar, or invoke the menu item Run > Run.

After the app build completes, you'll see the app on your device.

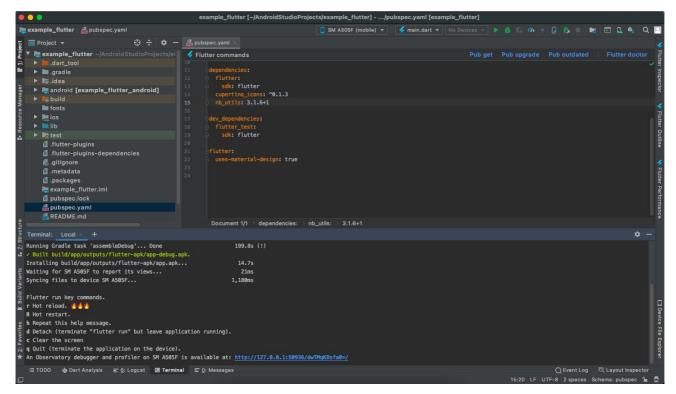

If you don't use Android Studio or IntelliJ you can use the command line to run your application using the following command

Important

Below step requires flutter path to be set in your Environment variables. See https://flutter.dev/docs/get-started/install/windows

flutter run

You will see below like screen after you have build your app successfully.

logo

Try hot reload

Flutter offers a fast development cycle with Stateful Hot Reload, the ability to reload the code of a live running app without restarting or losing app state. Make a change to app source, tell your IDE or command-line tool that you want to hot reload, and see the changein your simulator, emulator, or device.

Important

Do not stop your app. let your app run.

PROJECT STRUCTURE & FEATURES

- images: apps/widgets/snippets images as well as applcon are stored here.
- lib: Application main file and folder are located here.
 - Screens: Full Apps UI Code can be found here.
 - Components: Re-useable widget can be found here
 - constant: All constant value are located here
 - main: All the routes are been declared here.
- pubspec.yaml: Application name and other project dependencies can be found here.

Application Features

- Clean Code and a well structured project
- Single code base for both Android & iOS
- 60 FPS Support for both Android & iOS
- Fully responsive UI
- Best UI & UX
- · Dark and light modes
- · Great animation
- · Easy to customize
- Free life time updates & stunning customer supportEasy
- to integrate in your project

Firebase Setup:

Go to https://console.firebase.google.com/ > Add Project > Enter Project name and package name > Create app and download the google-service.json file. Copy all the codes in the json file and paste it in android > app > google-service.json file.

Then Add the Project information at lib > firebase_options.dart

```
| Solid | Soli
```

Admin Panel Setup:

Add your admin email to the lib > Screen > Widgets > Constant Data > constant.dart

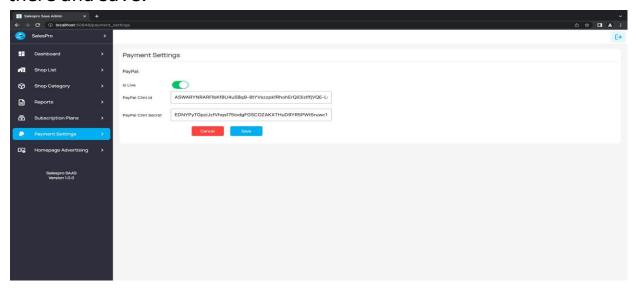

```
Pub get has not been run

| Pub get has not been run | Get dependencies | Upgrade dependenc
```

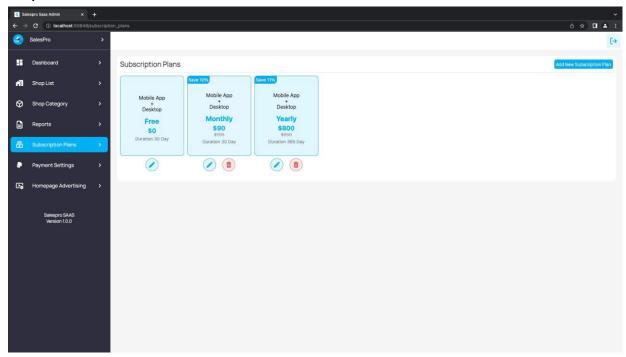

And change the firebase configuration at lib > firebase_options.dart

```
| Selection | Sele
```

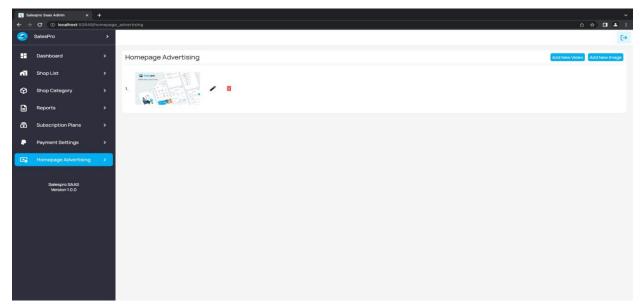

Paypal Setup: You have to setup admin panel first to be able to publish the mobile app. Go to Paypal Settings Menu. Add your credentials there and save.

Manage Pricing: You have to add at least one plan to be able to run the app. Go go Subscription Plan menu and add a new plan based on your requirements.

Promotional banner: You can add promotional banner from the admin panel. Go to the Homepage Advertising menu and set your advertising banner there.

HELP & SUPPORT

Free support policy includes troubleshooting, technical assistance with the product only. It does not include any customization, additional features integration or concerns about third-party plugins compatibility. But support is applied to plugin(s) we have developed and integrated ourselves. We appreciate your understanding!

If you need assistance and information on purchased product that is not covered in documentation, mail them on our support at

maantheme@gmail.com, Skype: https://join.skype.com/invite/kEPqImF1Vfqk

You can expect answer within 24-48 hours, usually as soon as possible in the order they were received.

Additionally, if any email has no response from the item owner for more than 7 days, that support email will be archived by default. However, if you need further assistance, you can mail us again.
